

Getting Started with Mesos

Arun Gupta, @arungupta
VP Developer Advocacy, Couchbase

Mesos

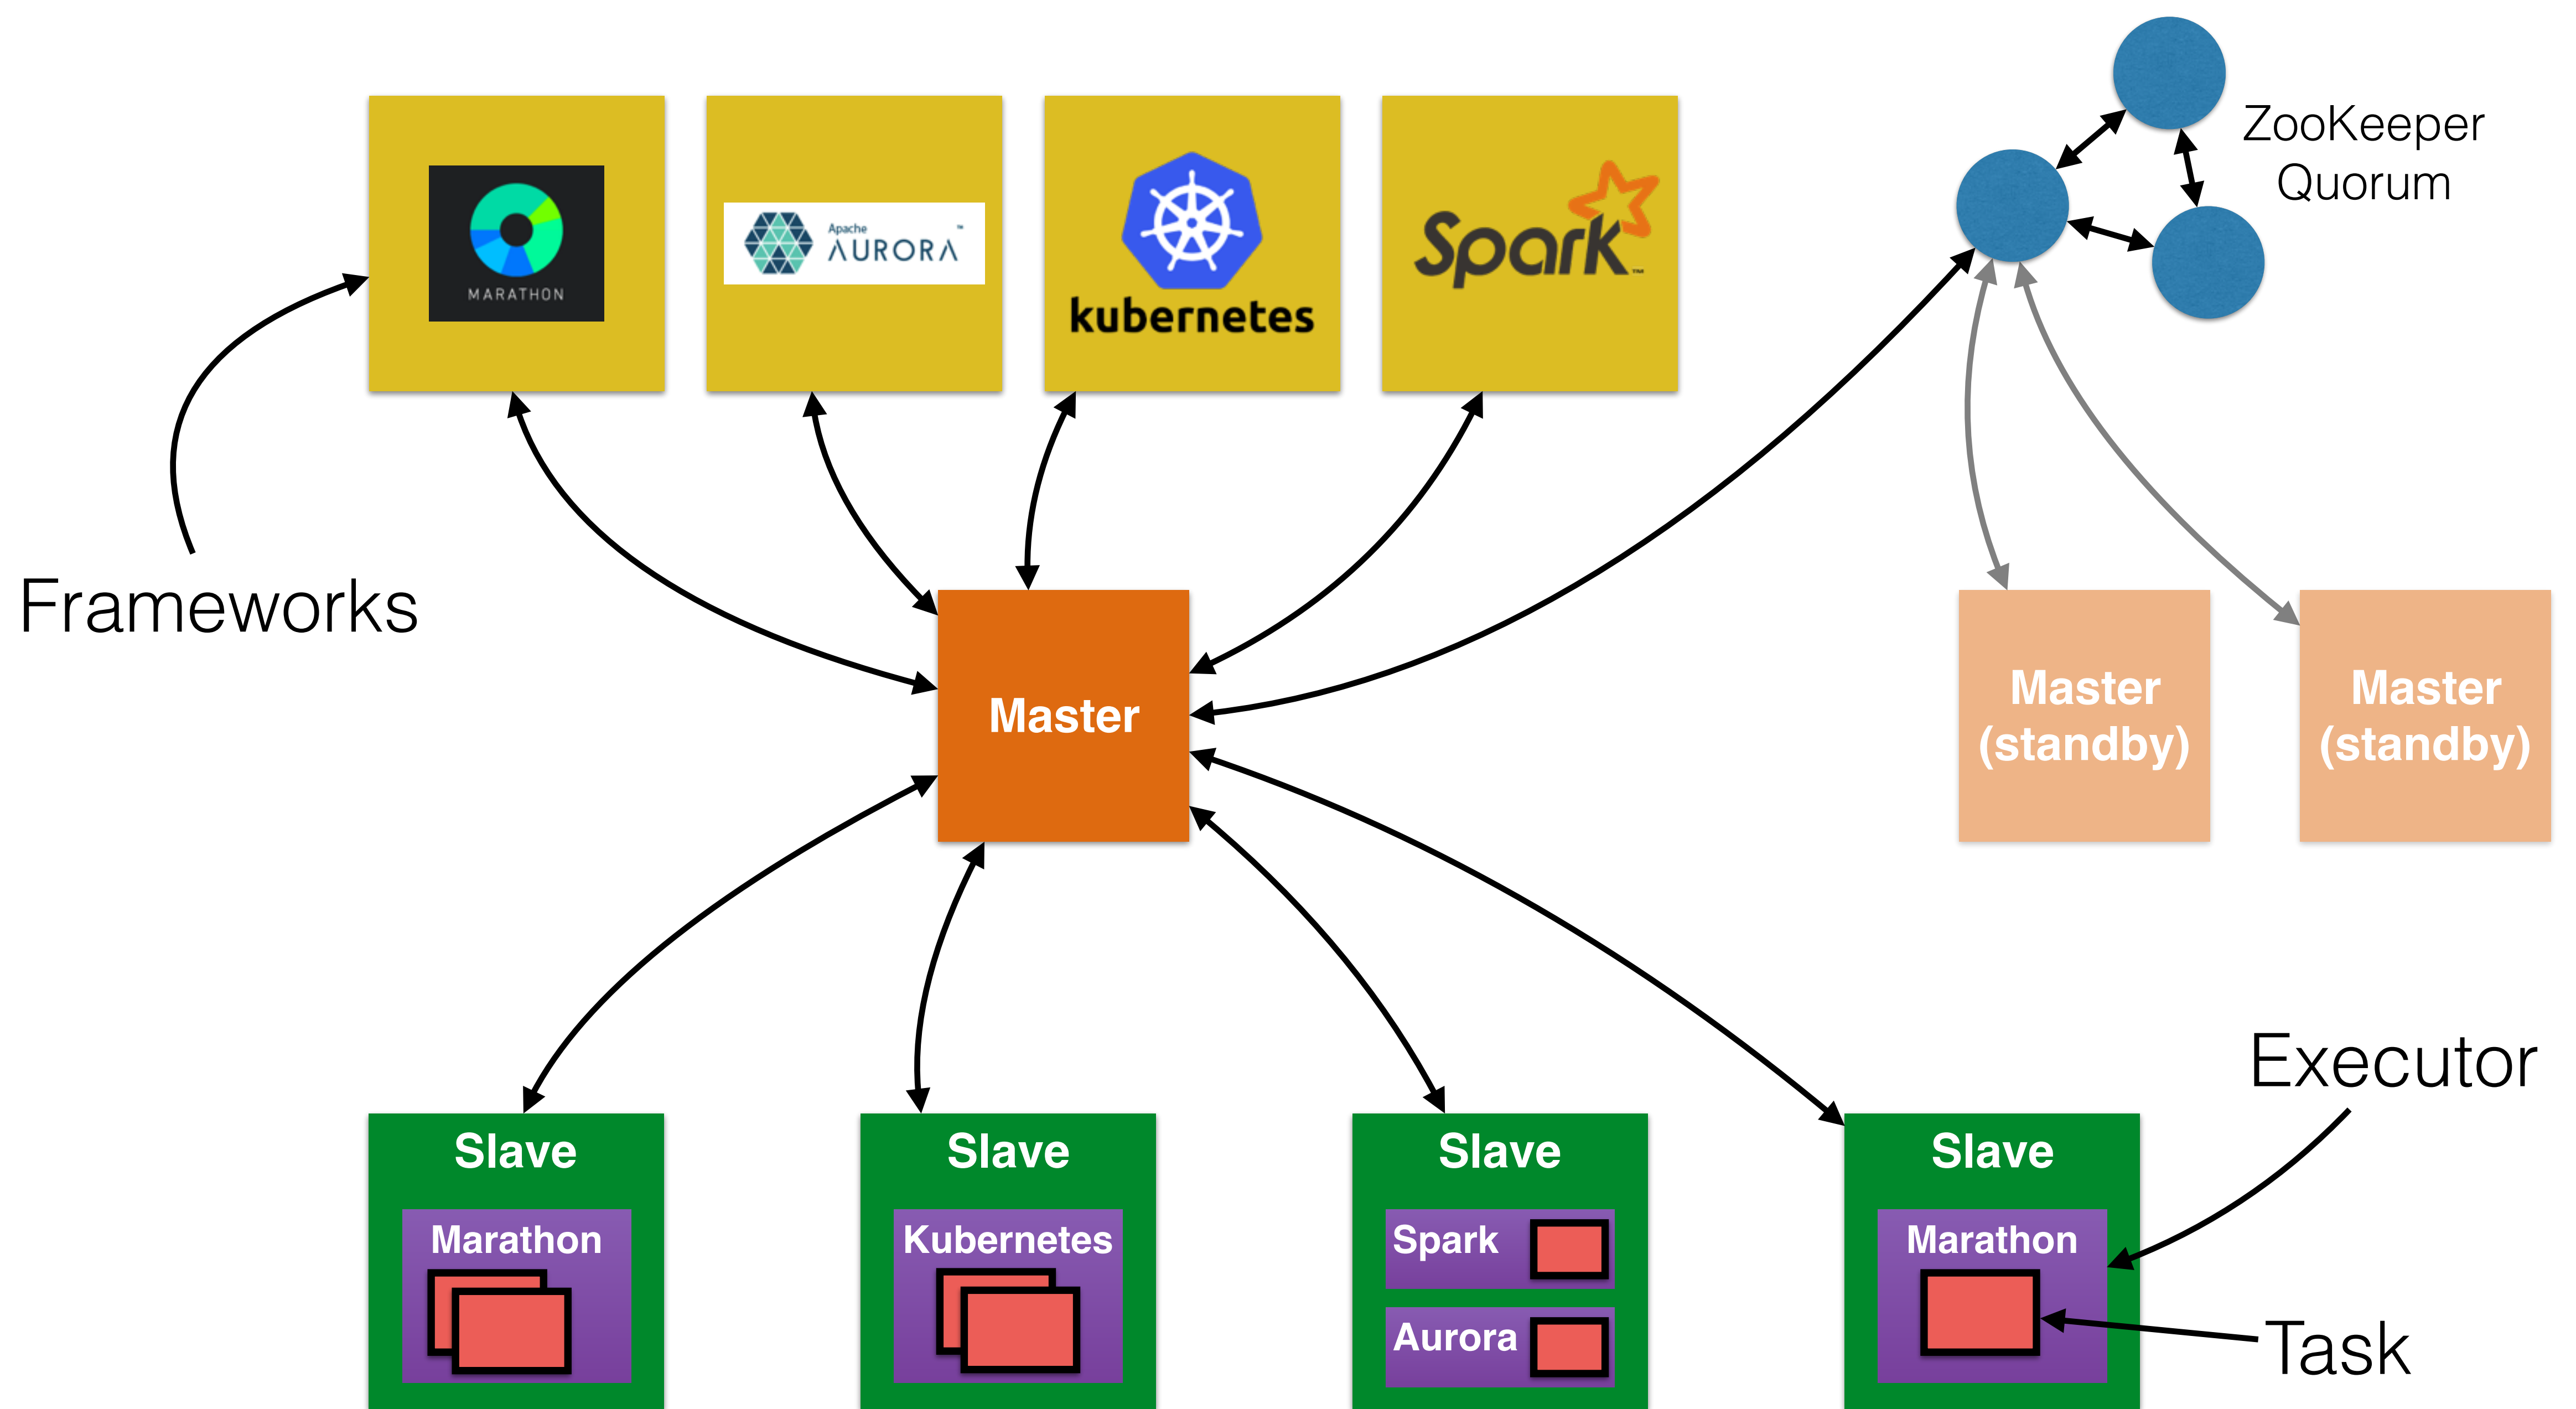

- Open source cluster manager
- Developed at UC Berkeley
- Provides resource isolation and sharing across distributed applications
- Run distributed systems on the same pool of nodes
 - Hadoop, Spark, Jenkins, Couchbase, ...
- Cluster monitoring
- Tasks isolated via Linux containers

Mesos

- Master Slave architecture
- Fault tolerant
 - Leader election via ZooKeeper
- Multi platform
 - Ubuntu, Mac OS, CentOS

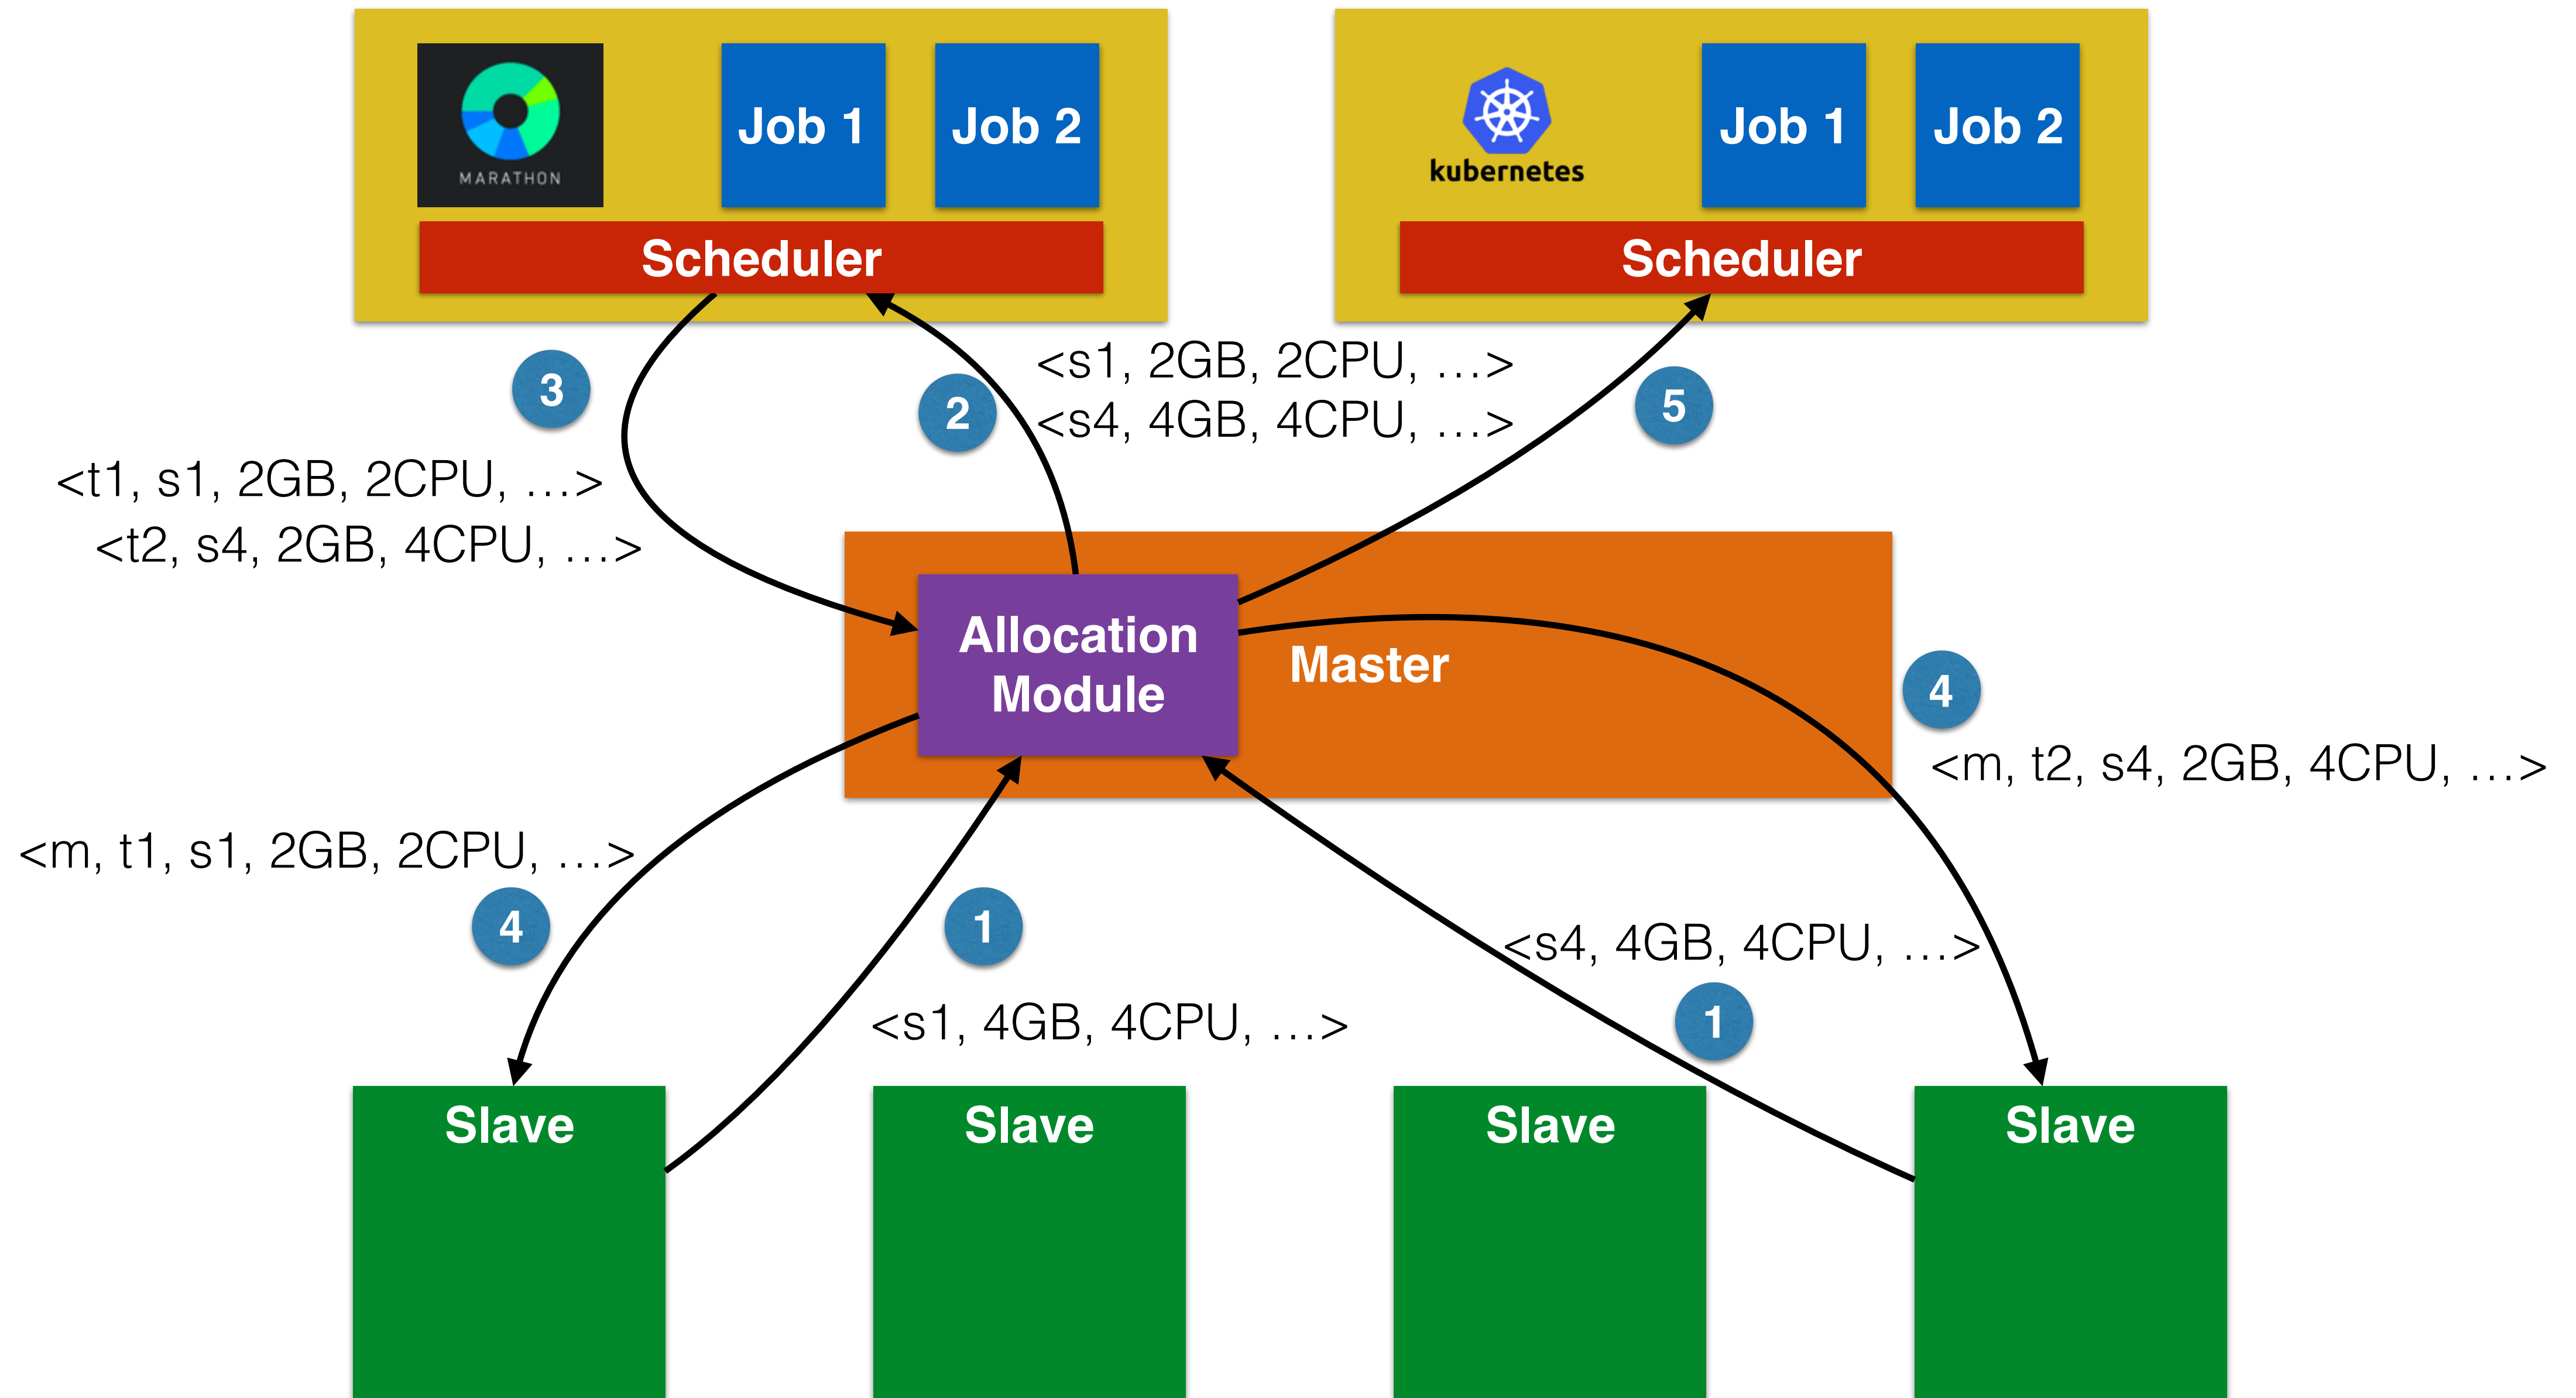

Mesos Architecture

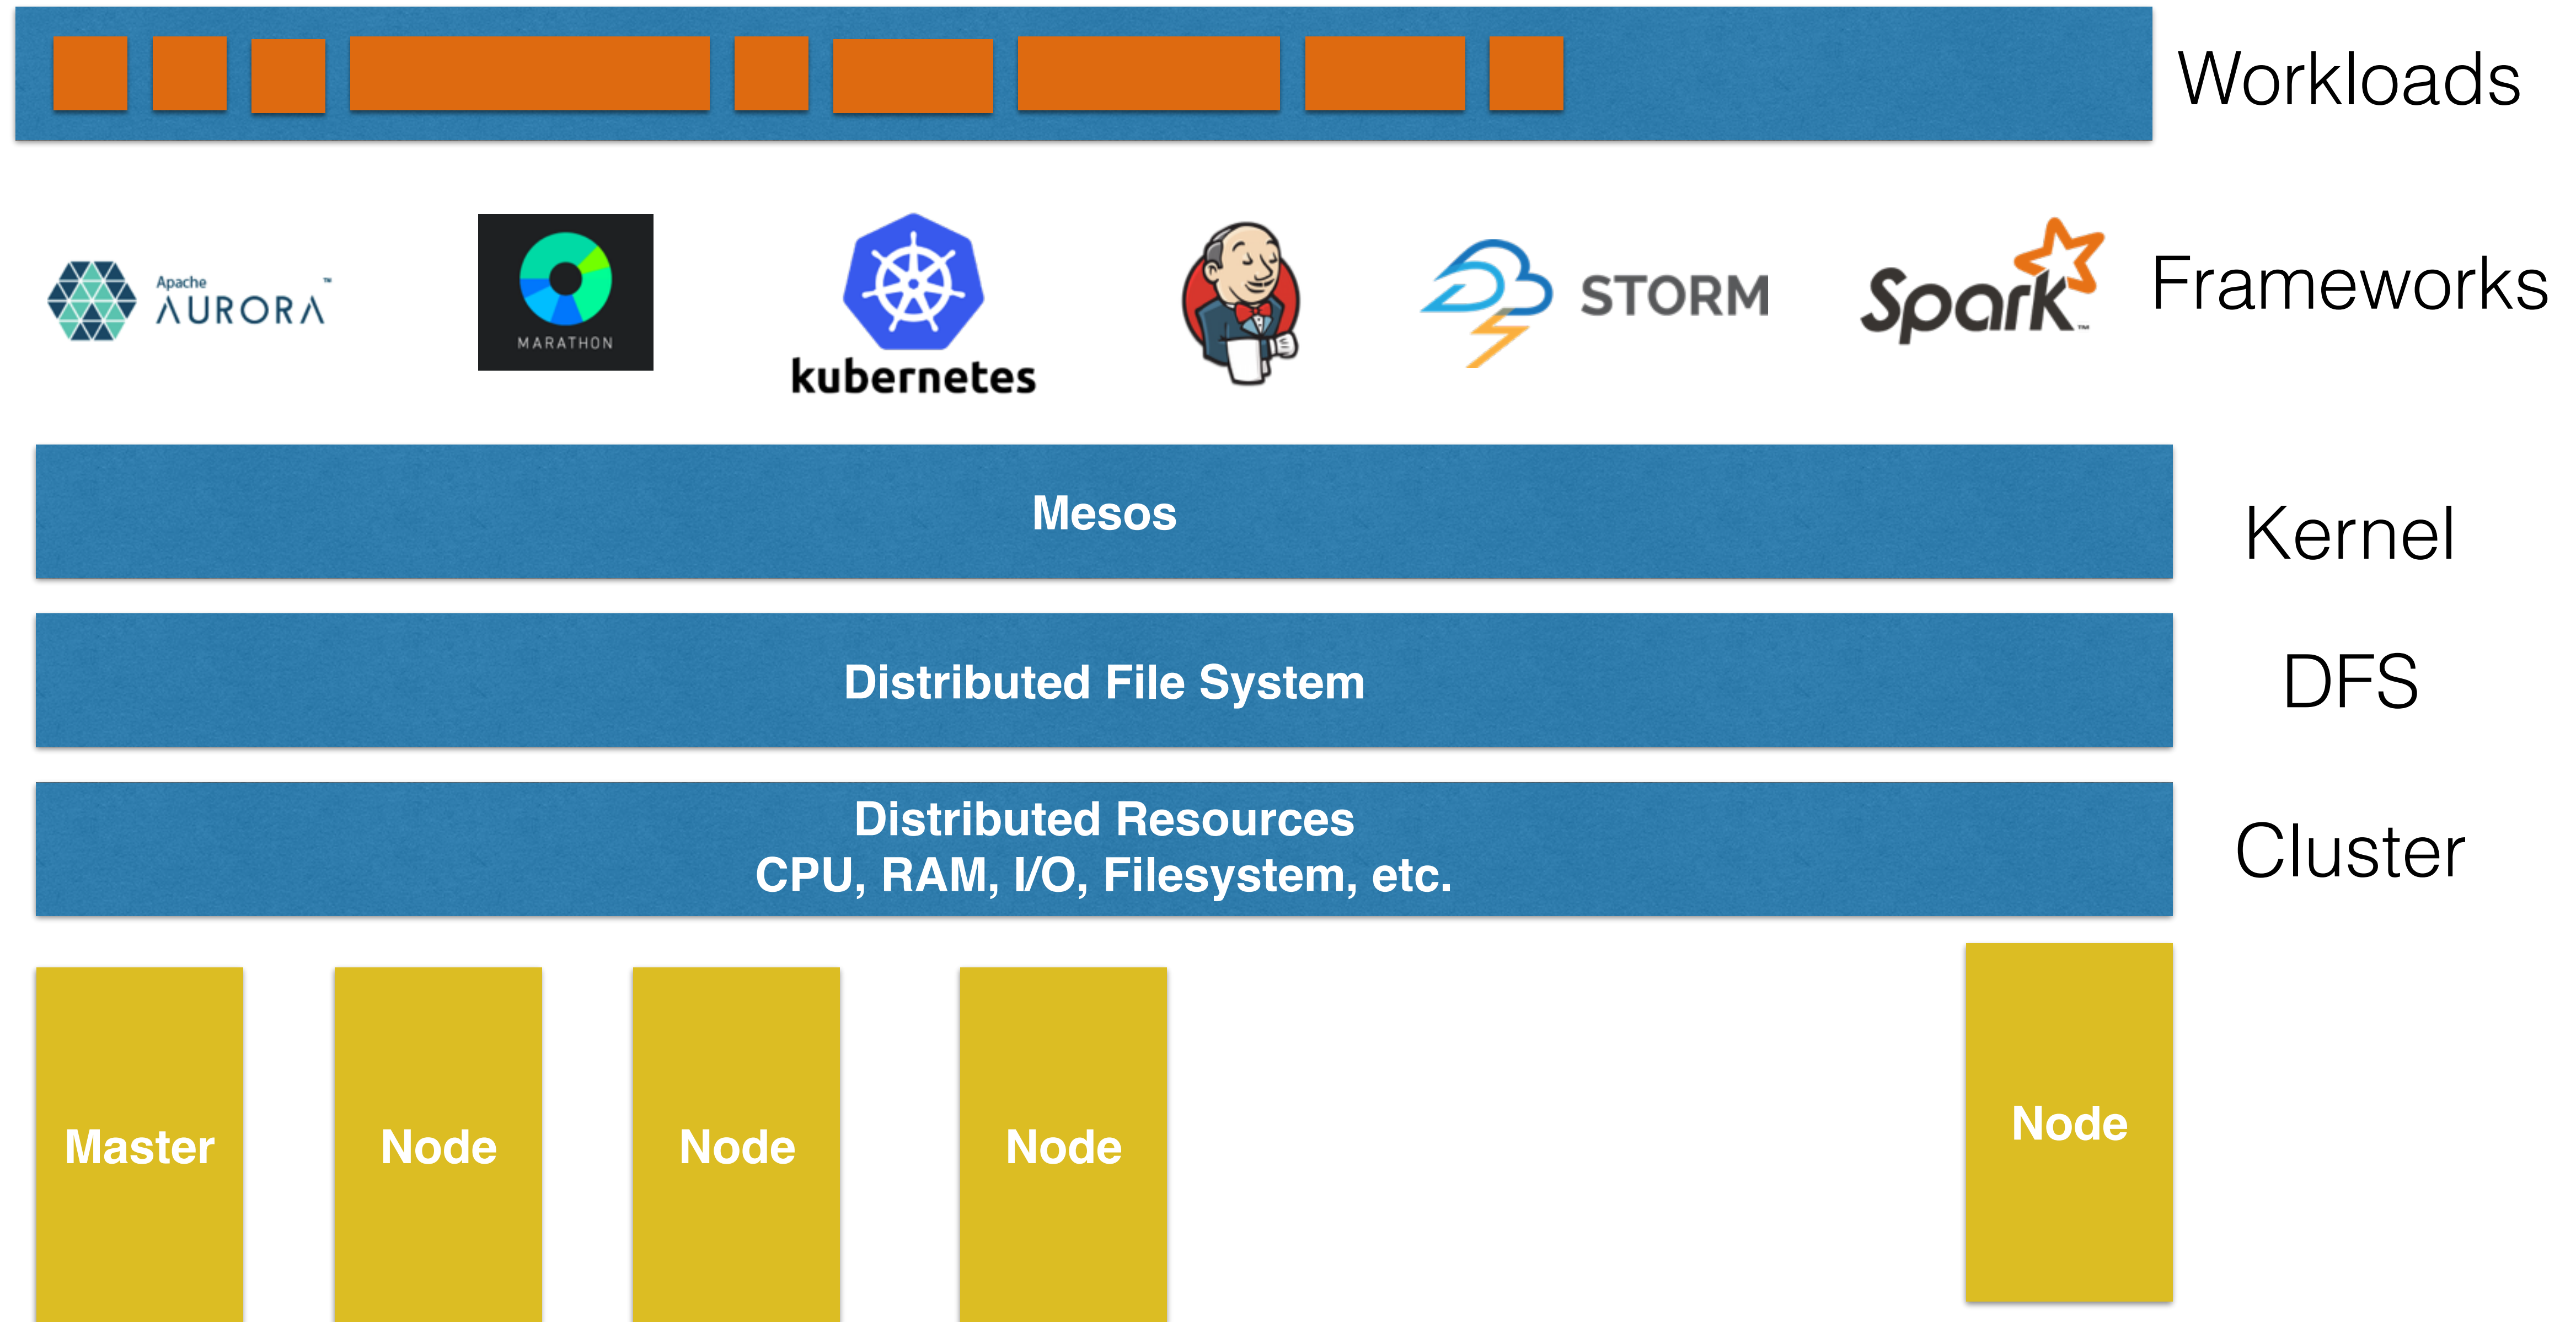

Frameworks

- Frameworks are targeted at a use case and domain-specific
 - Master node “offers” resources to each framework
 - Framework “accepts” the offer and execute applications
- Framework has “scheduler” and “executor”
 - Scheduler registers with the master for “offer”
 - Executor launched on slave nodes to run the task
 - Passes a description of the task to run

- Built using the same principles as the Linux kernel, at a different level of abstraction
 - Computer: Data center
 - Kernel: Mesos
 - Application: Distributed application
 - Operating system: Mesos + Framework + Ecosystem

docker

kubernetes
