

Kubernetes Introduction

Arun Gupta

Vice President, Developer Advocacy

@arungupta, blog.arungupta.me

arun@couchbase.com

Kubernetes

- Open source orchestration system for Docker containers
- Provide declarative primitives for the “desired state”
 - Self-healing
 - Auto-restarting
 - Schedule across hosts
 - Replicating

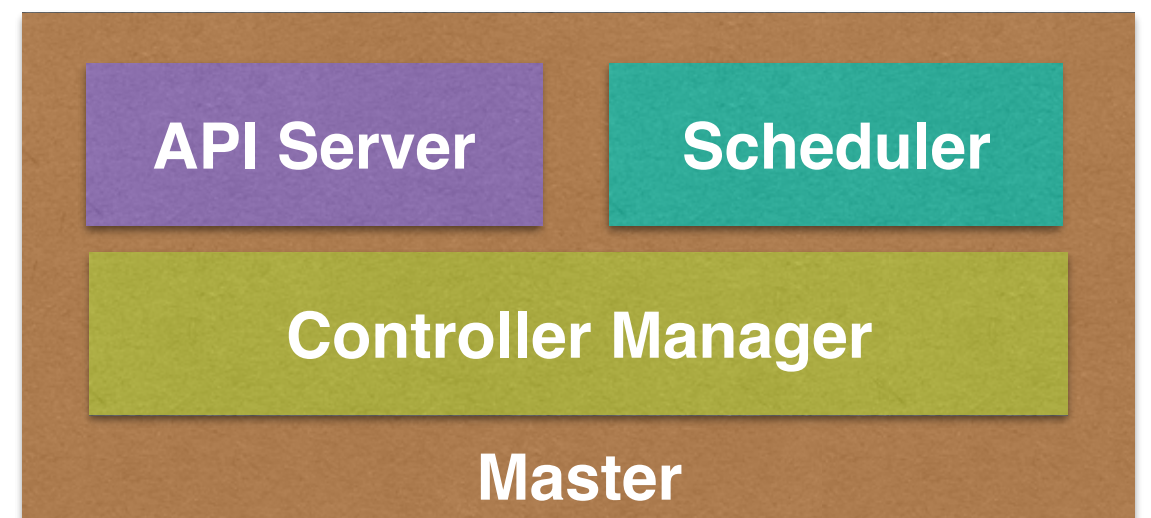

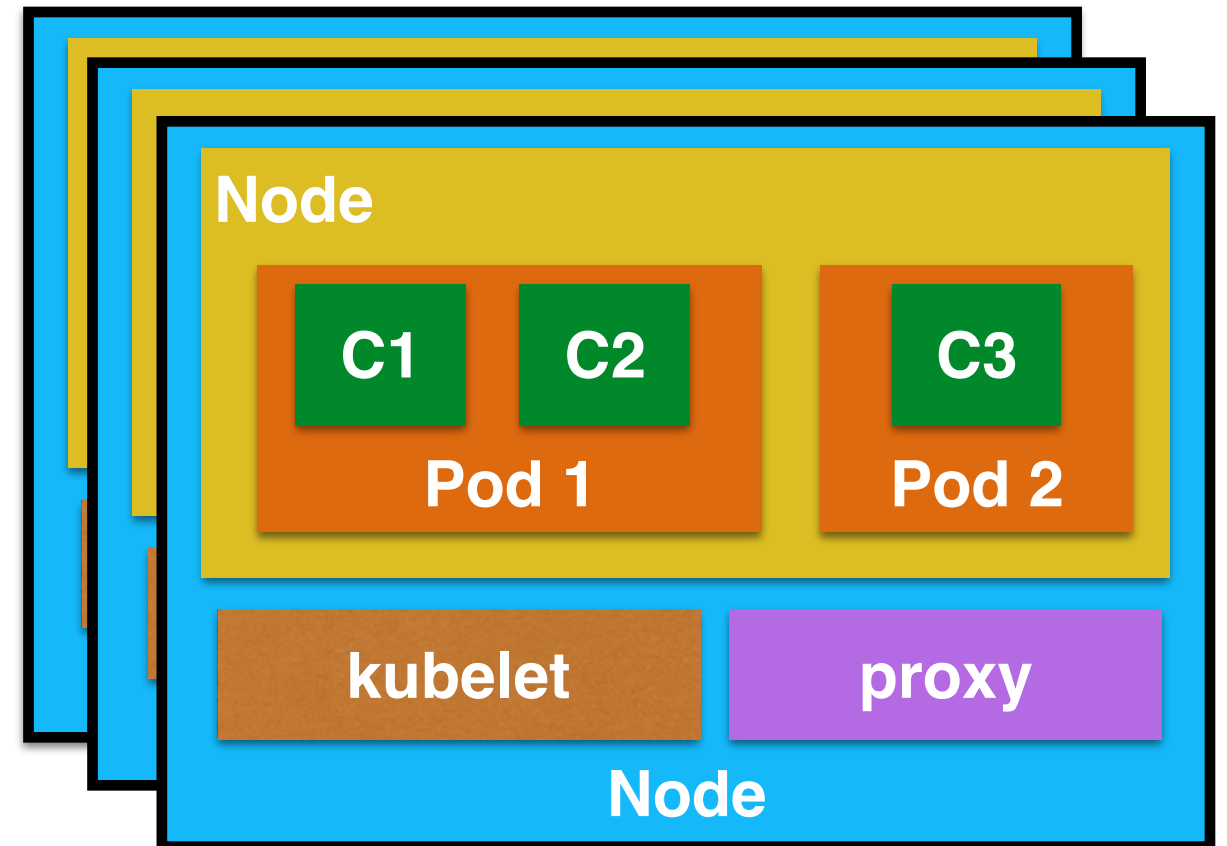

Concepts

- **Pods:** collocated group of Docker containers that share an IP and storage volume
- **Service:** Single, stable name for a set of pods, also acts as LB
- **Label:** used to organize and select group of objects
- **Replication Controller:** manages the lifecycle of pods and ensures specified number are running

Components

- **Node:** Docker host running *kubelet* (node agent) and *proxy* services
 - Monitored by *systemd* (CentOS) or *monit* (Debian)
- **Master:** hosts cluster-level control services, including the API server, scheduler, and controller manager
- **etcd:** distributed key-value store used to persist Kubernetes system state

Architecture

Master High Availability

- Hack by running a `podmaster` utility
- Proposal
 - Hot Standby
 - Warm Standby
 - Active-Active (Load Balanced)

kubectl

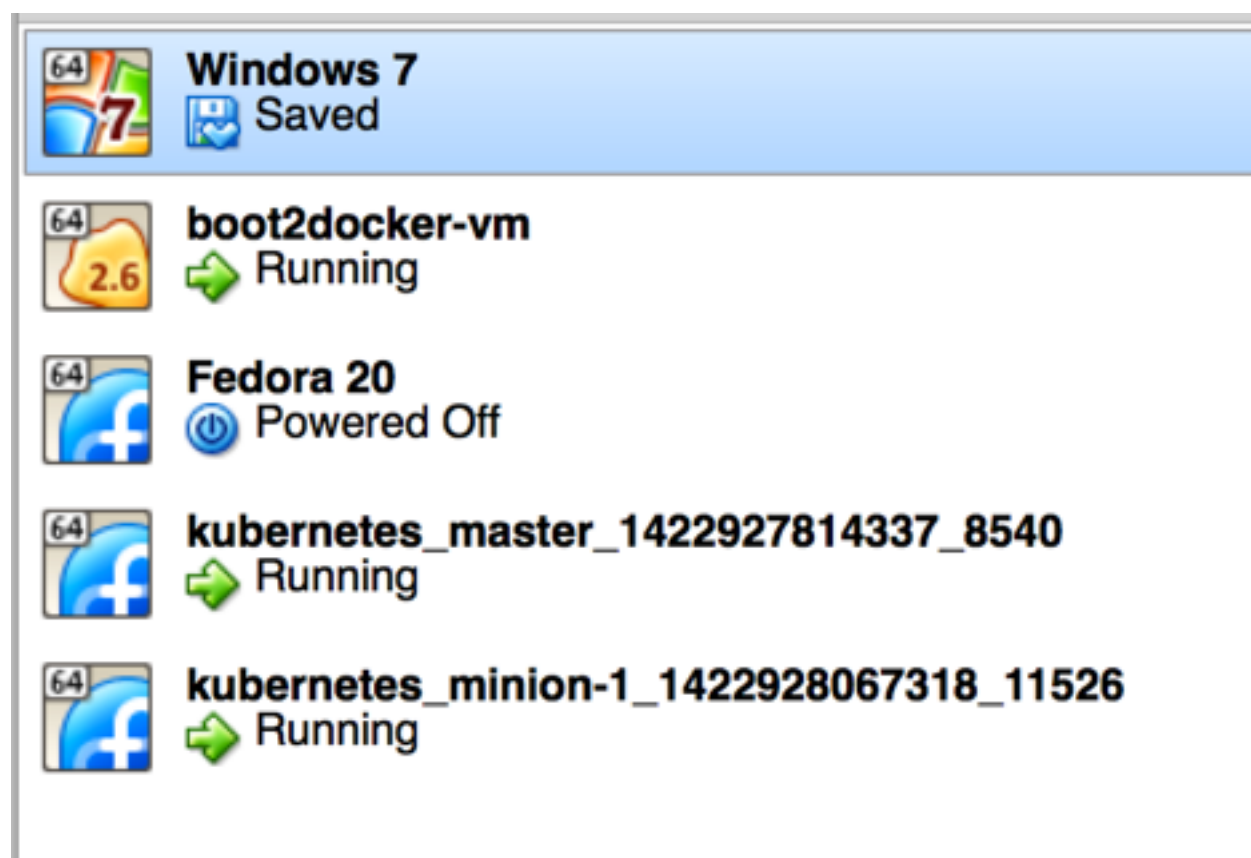

- Controls the Kubernetes cluster manager
- `kubectl get pods or minions`
- `kubectl create -f <filename>`
- `kubectl update or delete`
- `kubectl resize --replicas=3
replicationcontrollers <name>`

Kubernetes Config

```
1  apiVersion: v1
2  kind: Pod
3  metadata:
4    name: wildfly-pod
5    labels:
6      name: wildfly
7  spec:
8    containers:
9      - image: jboss/wildfly
10      name: wildfly-pod
11      ports:
12        - containerPort: 8080
```

```
1  apiVersion: v1
2  kind: ReplicationController
3  metadata:
4    name: wildfly-rc
5    labels:
6      name: wildfly
7  spec:
8    replicas: 2
9    template:
10      metadata:
11        labels:
12          name: wildfly
13      spec:
14        containers:
15          - name: wildfly-rc-pod
16            image: jboss/wildfly
17            ports:
18              - containerPort: 8080
```

```
export KUBERNETES_PROVIDER=vagrant  
./cluster/kube-up.sh
```

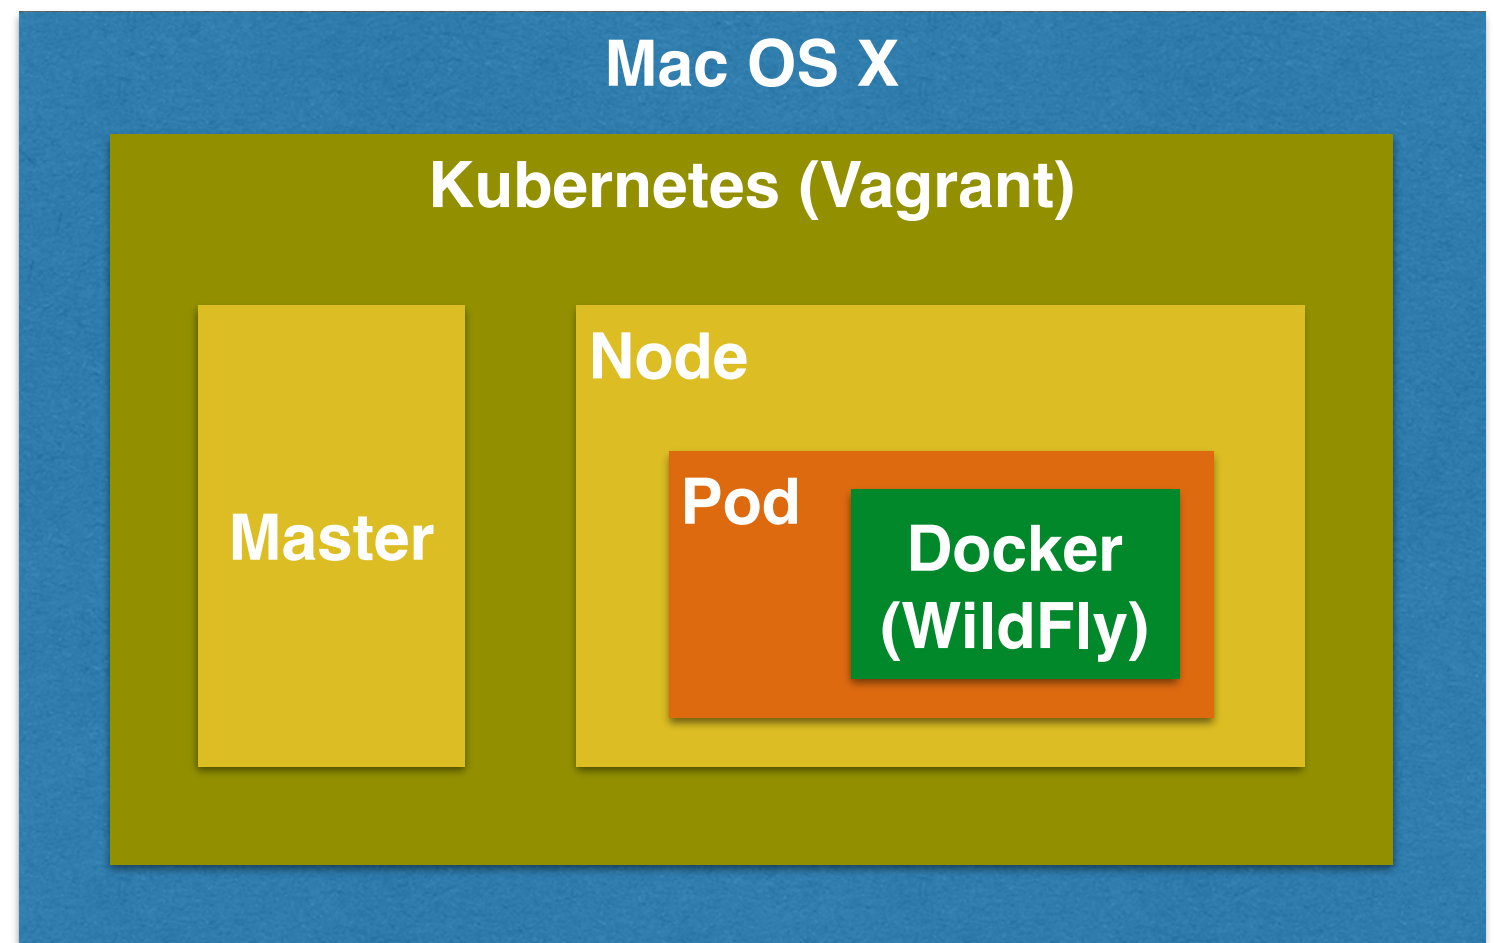

<https://get.k8s.io/>

A Pod with One Container

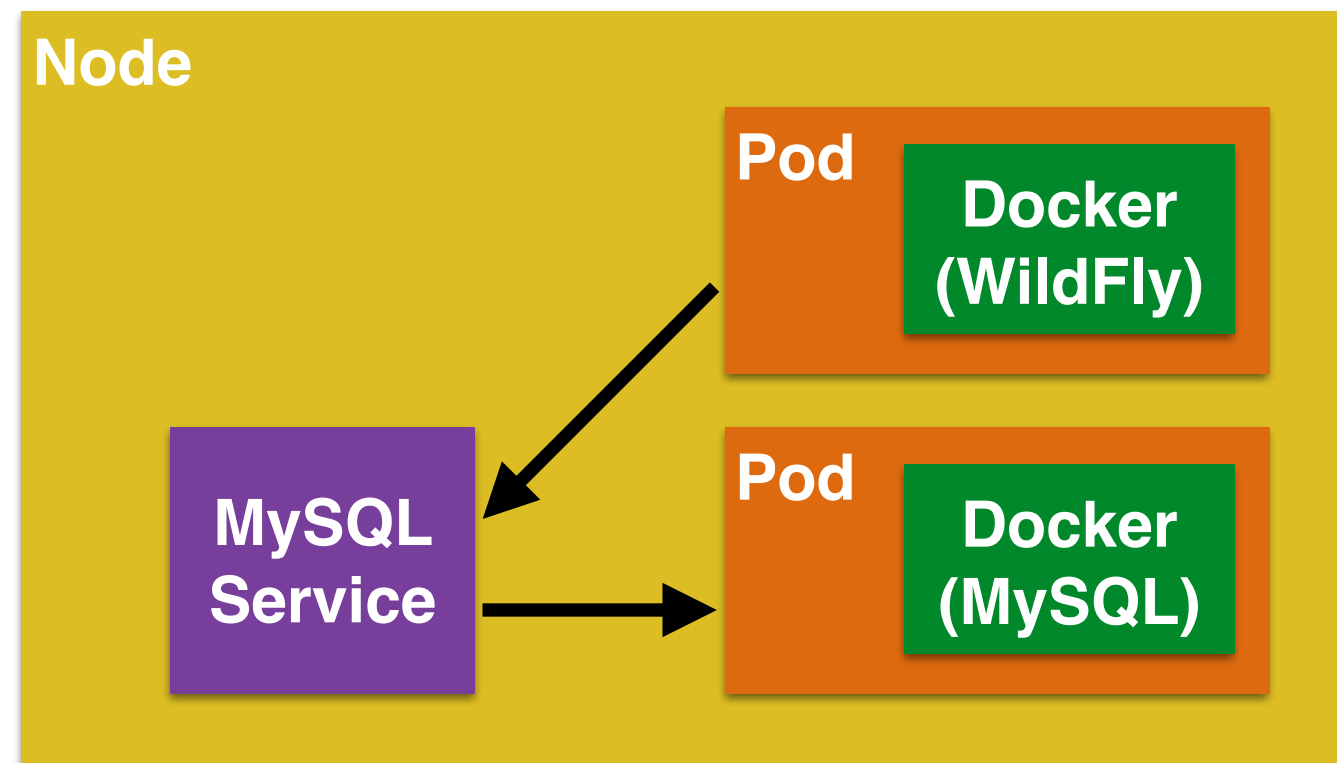

```
1  apiVersion: v1
2  kind: Pod
3  metadata:
4    name: wildfly-pod
5    labels:
6      name: wildfly
7  spec:
8    containers:
9      - image: jboss/wildfly
10      name: wildfly-pod
11      ports:
12        - containerPort: 8080
```

Services

- Abstract a set of pods as a single IP and port
 - Simple TCP/UDP load balancing
- Creates environment variables in other pods
 - Like “Docker links” but across hosts
- Stable endpoint for pods to reference
 - Allows list of pods to change dynamically

Services

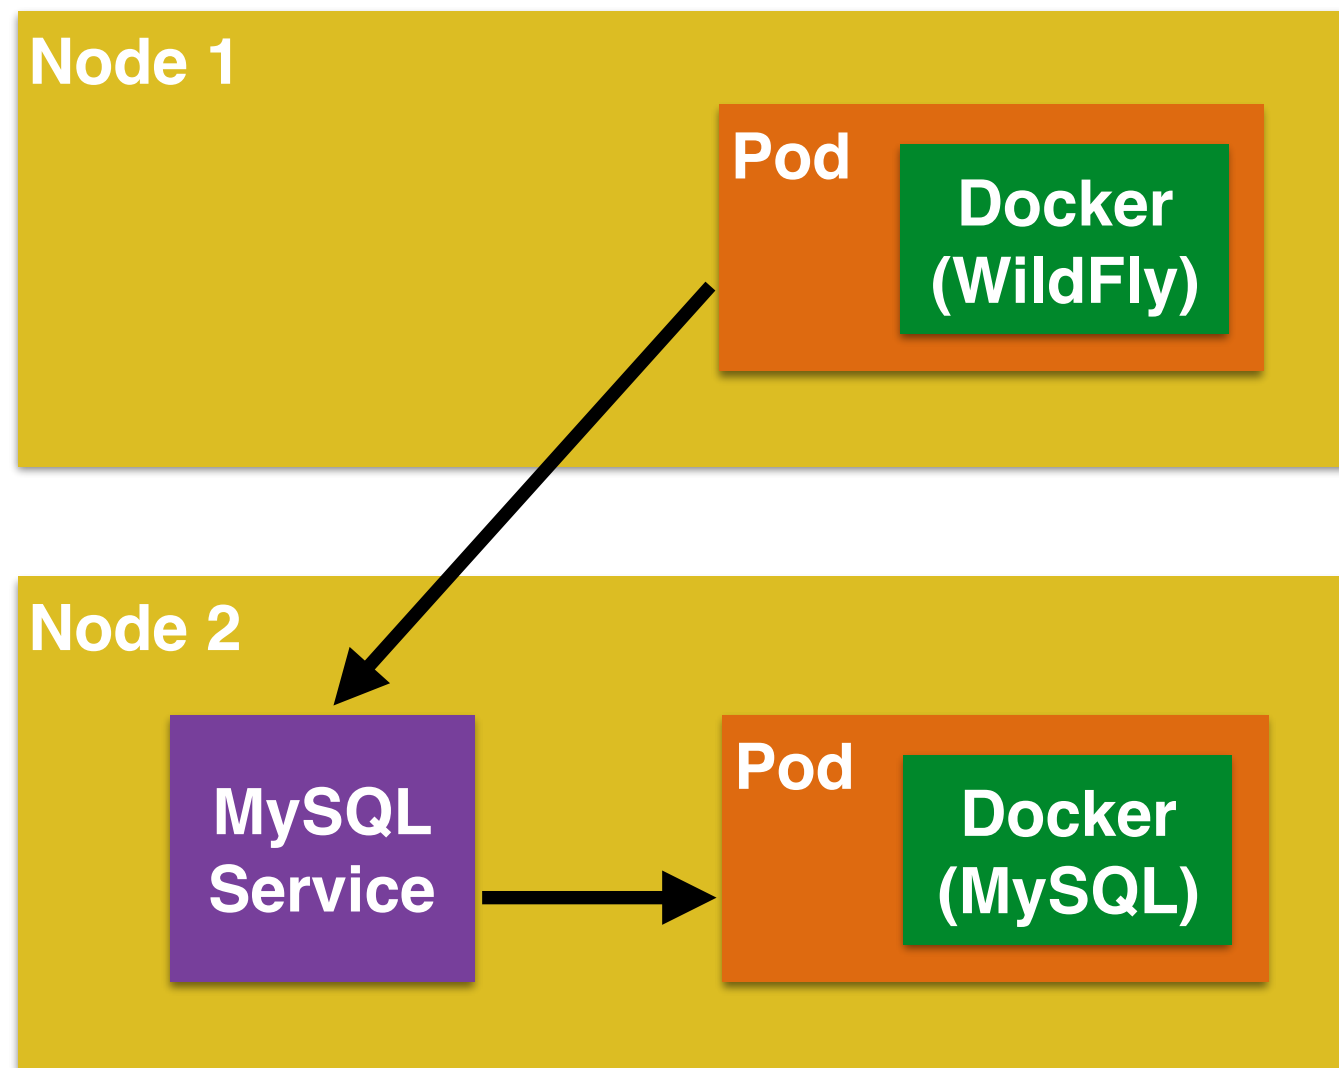

Services

```
1  apiVersion: v1
2  kind: Pod
3  metadata:
4    name: mysql-pod
5    labels:
6      name: mysql-pod
7      context: docker-k8s-lab
8  spec:
9    containers:
10     -
11       name: mysql
12       image: mysql:latest
13       env:
14         -
15           name: "MYSQL_USER"
16           value: "mysql"
17         -
18           name: "MYSQL_PASSWORD"
19           value: "mysql"
20         -
21           name: "MYSQL_DATABASE"
22           value: "sample"
23         -
24           name: "MYSQL_ROOT_PASSWORD"
25           value: "supersecret"
26       ports:
27         -
28           containerPort: 3306
```

```
1  apiVersion: v1
2  kind: Service
3  metadata:
4    name: mysql-service
5    labels:
6      name: mysql-pod
7      context: docker-k8s-lab
8  spec:
9    ports:
10     # the port that this service should
11     port: 3306
12     # label keys and values that must mat
13     selector:
14       name: mysql-pod
15       context: docker-k8s-lab
```

Service across Two Nodes

Replication Controller

- Ensures that a specified number of pod "replicas" are running
 - Pod templates are cookie cutters
 - Rescheduling
 - Manual or auto-scale replicas
 - Rolling updates
- Recommended to wrap a Pod or Service in a RC
- Only appropriate for Pods with `Restart=Always` policy (default)

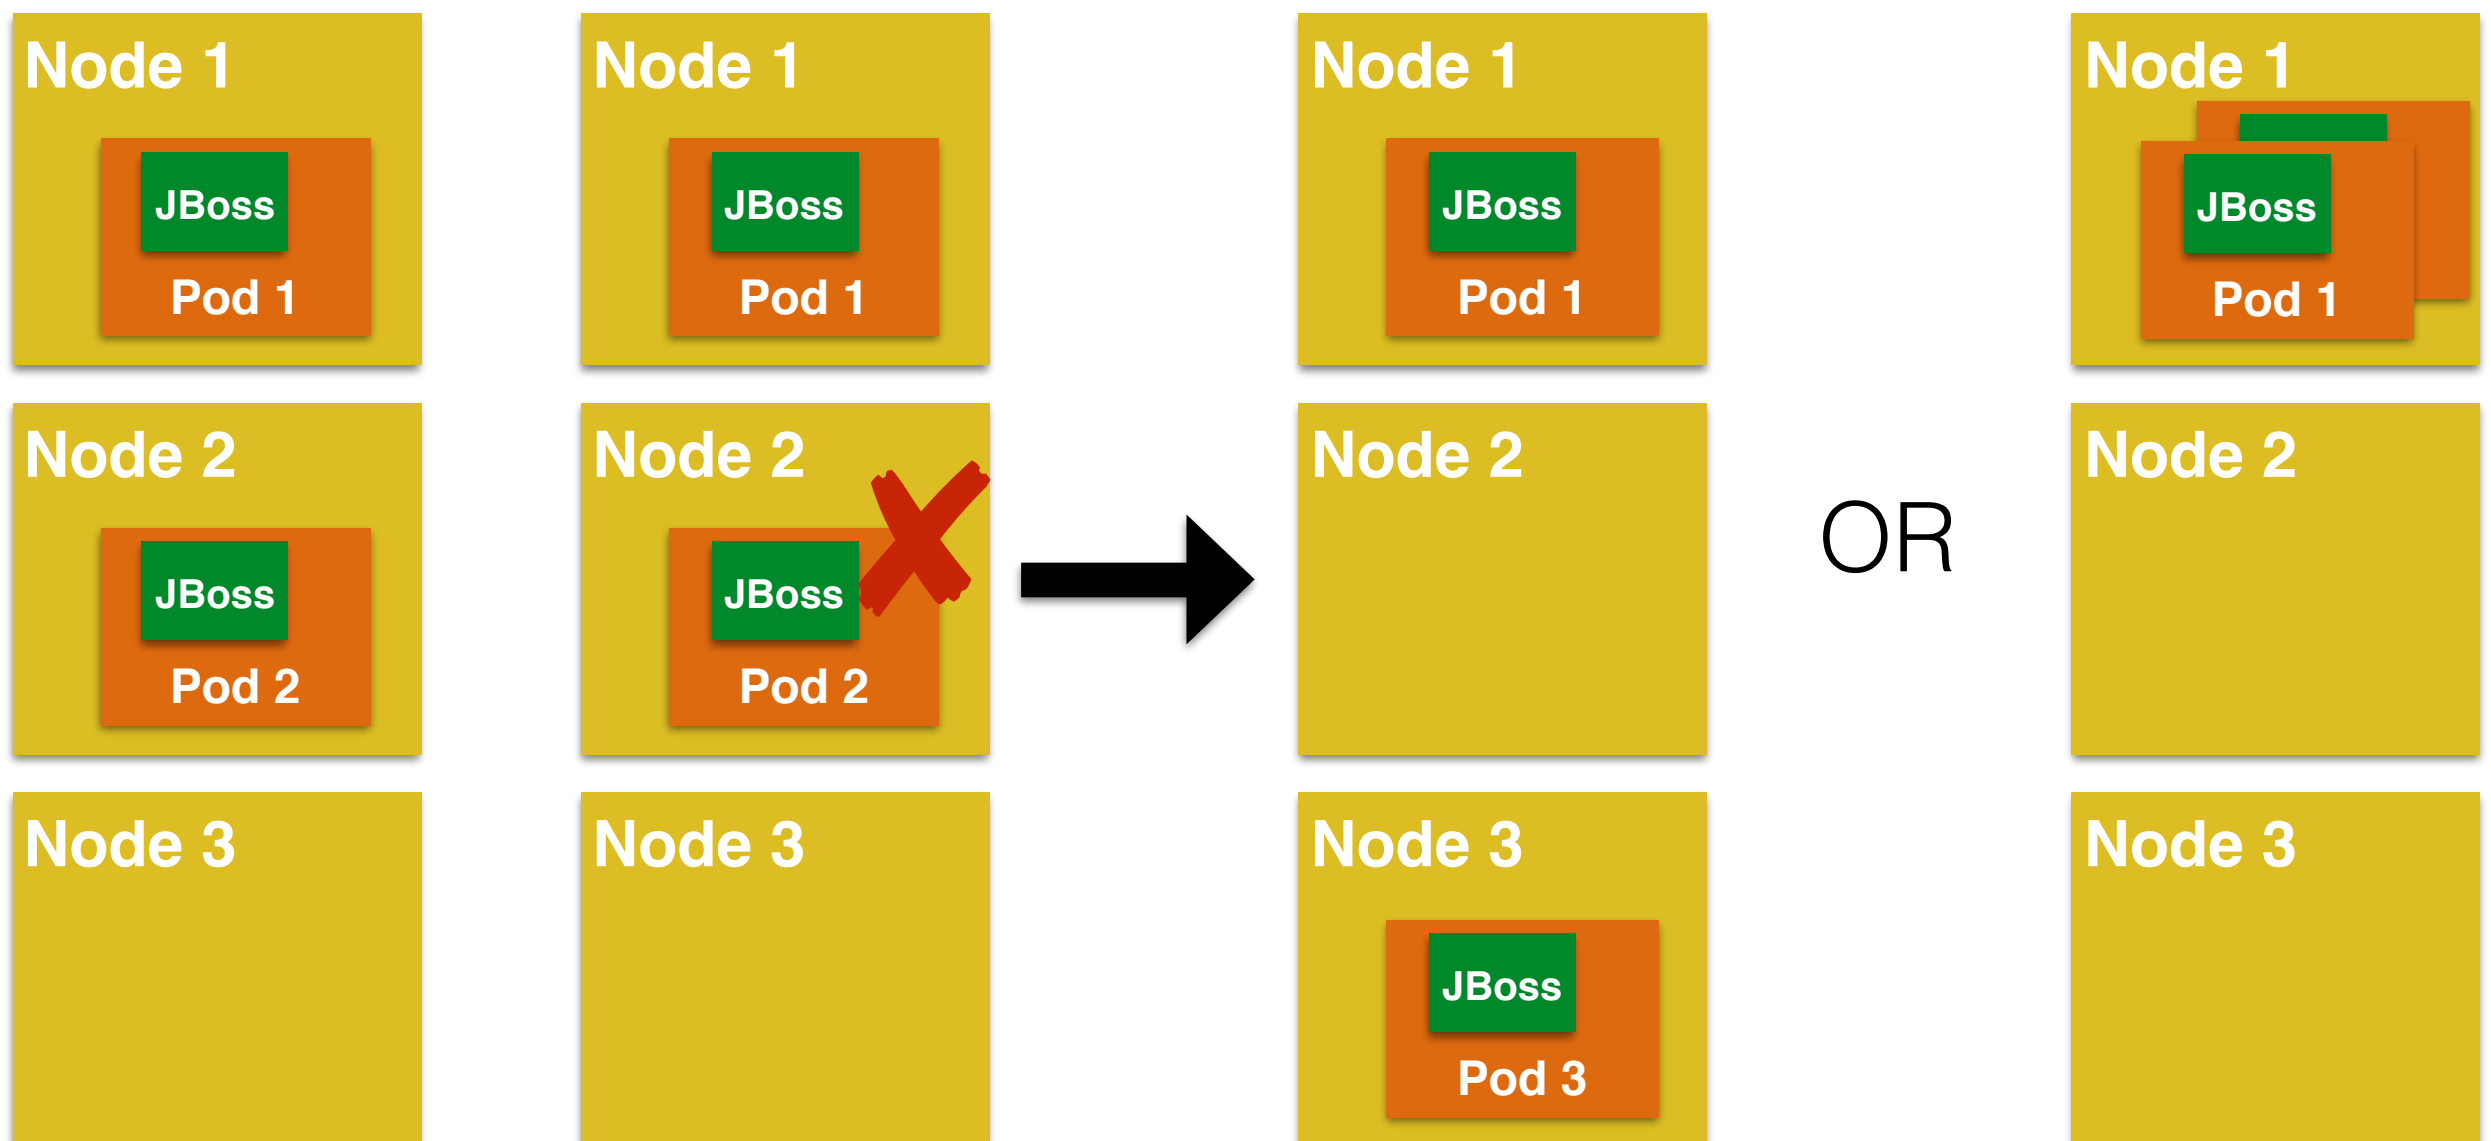

Replication Controller Configuration

```
1  apiVersion: v1
2  kind: ReplicationController
3  metadata:
4    name: wildfly-rc
5    labels:
6      name: wildfly
7      context: docker-k8s-lab
8  spec:
9    replicas: 1
10   template:
11     metadata:
12       labels:
13         name: wildfly
14     spec:
15       containers:
16         - name: wildfly-rc-pod
17           image: arungupta/wildfly-mysql-javaee7:k8s
18           ports:
19             - containerPort: 8080
```

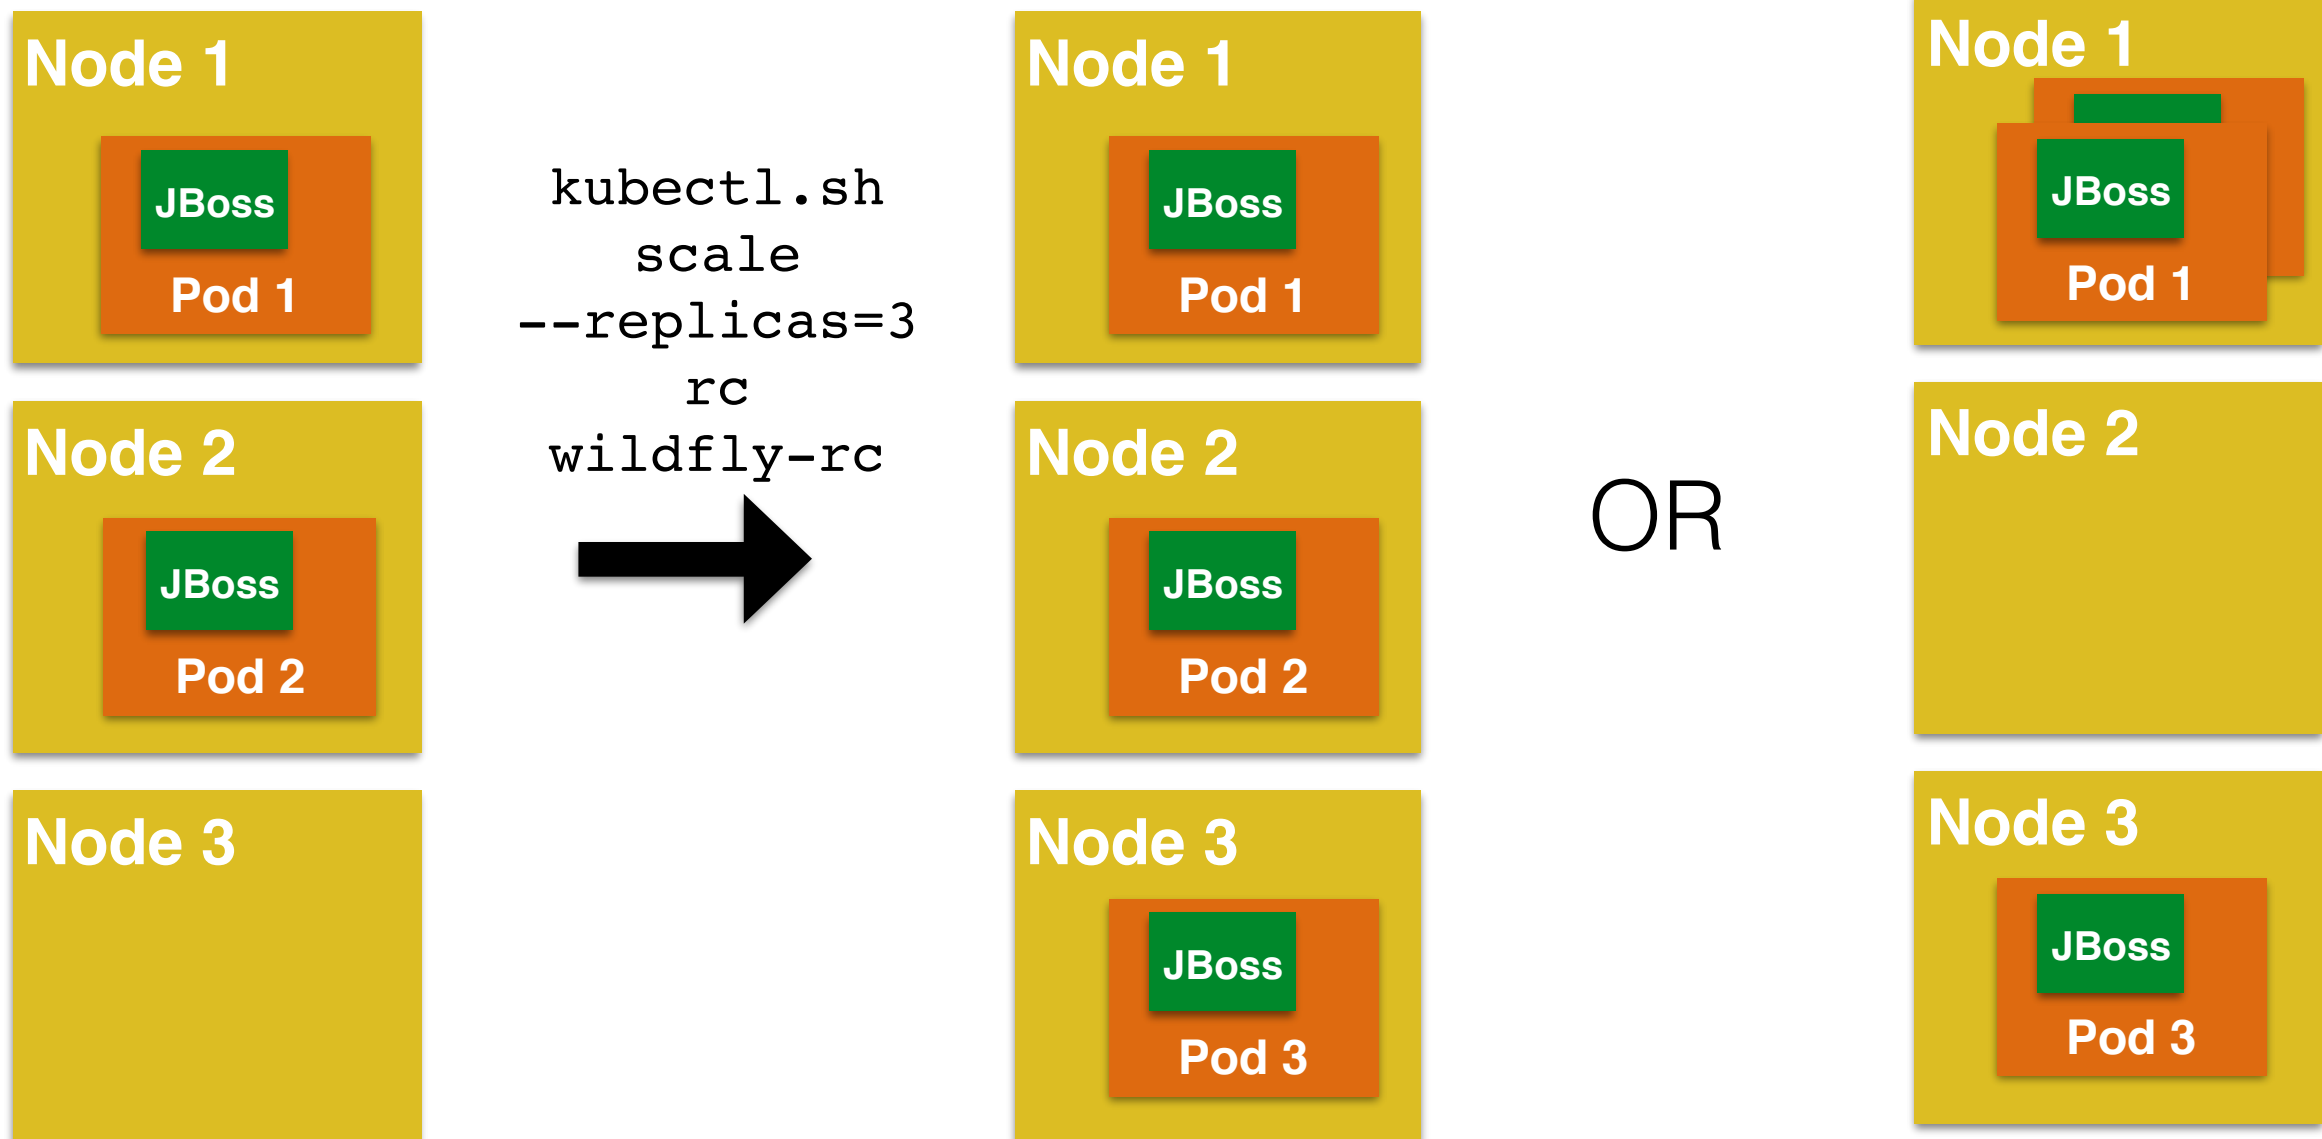

Replication Controller

Replication Controller: Automatic Rescheduling

Replication Controller: Scaling

Sample Production Deployment

- www.wombatsoftware.de
- shopadvisors.de: E-commerce optimization and monitoring tools for increase of sales

Sample Production Deployment

| Load | Containers |
|--------|------------|
| Normal | 400 |
| Peak | 600 |

Health Checks

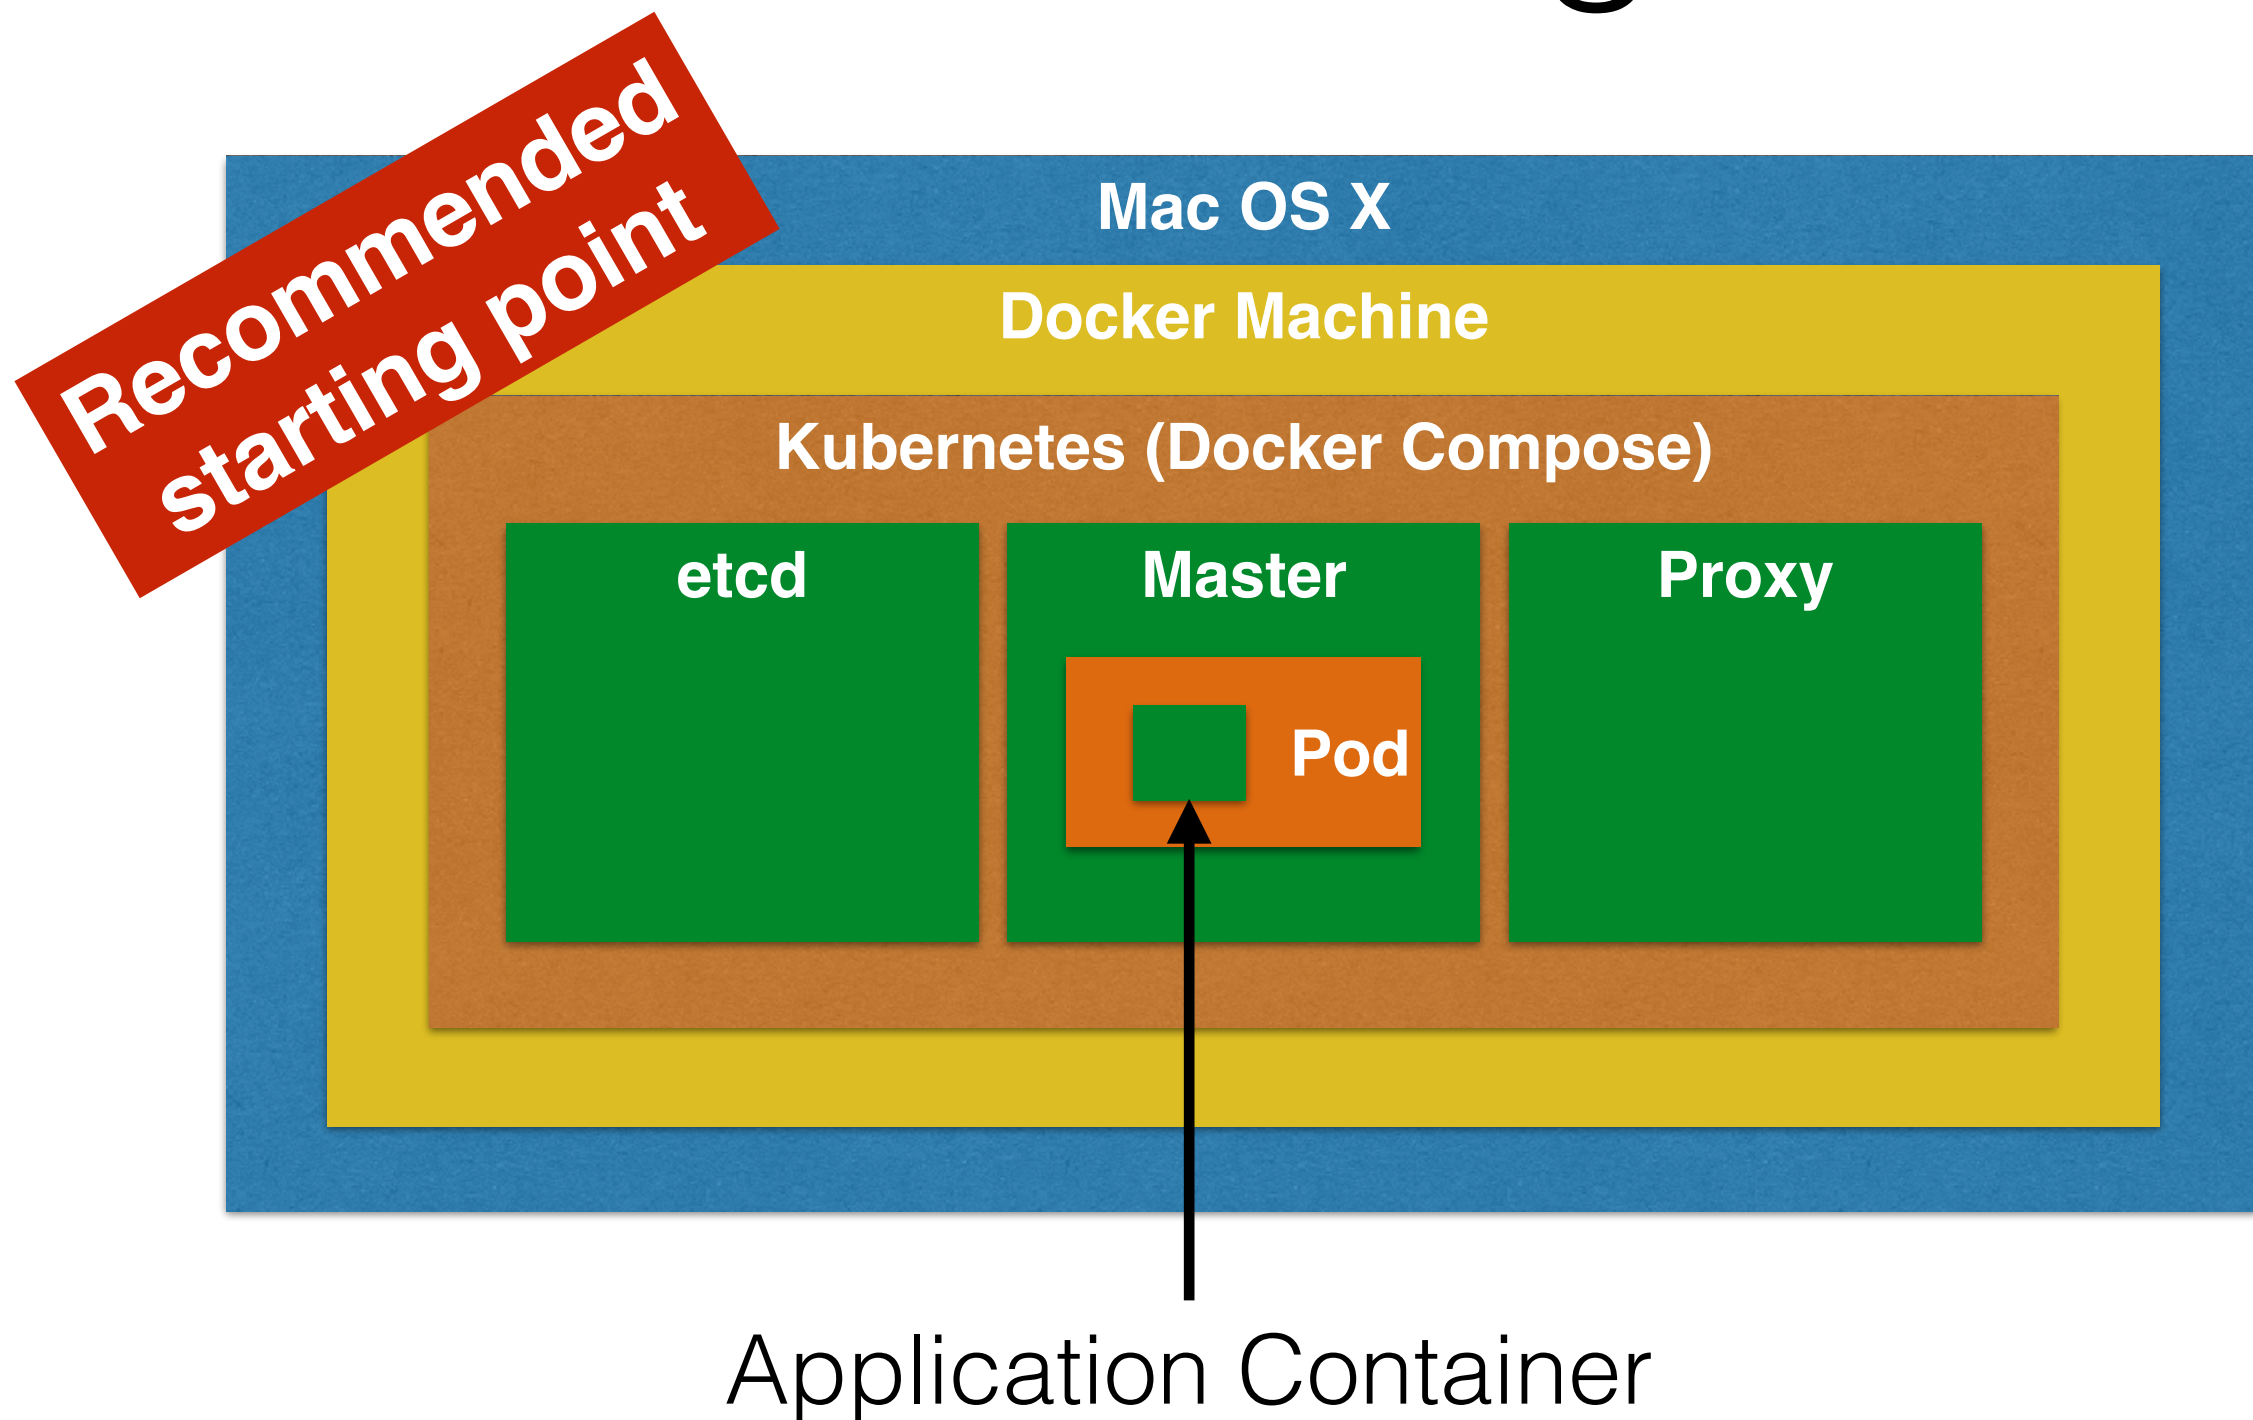

- Restarts Pod, if wrapped in RC
- Application-level health checks
 - HTTP
 - Container Exec
 - TCP Socket
- Health checks performed by Kubelet

Kubernetes using Docker

```
1  etcd:
2    image: gcr.io/google_containers/etcd:2.0.9
3    net: "host"
4    entrypoint: /usr/local/bin/etcd --addr=127.0.0.1:4001 --bind-addr=0.0.0.0:4001 --data-dir=/v
5  master:
6    image: gcr.io/google_containers/hyperkube:v0.21.2
7    net: "host"
8    volumes:
9      - /var/run/docker.sock:/var/run/docker.sock
10   entrypoint: /hyperkube kubelet --api_servers=http://localhost:8080 --v=2 --address=0.0.0.0
11  proxy:
12    image: gcr.io/google_containers/hyperkube:v0.21.2
13    net: "host"
14    privileged: true
15   entrypoint: /hyperkube proxy --master=http://127.0.0.1:8080 --v=2
```
